

Supplementary Figures and Tables

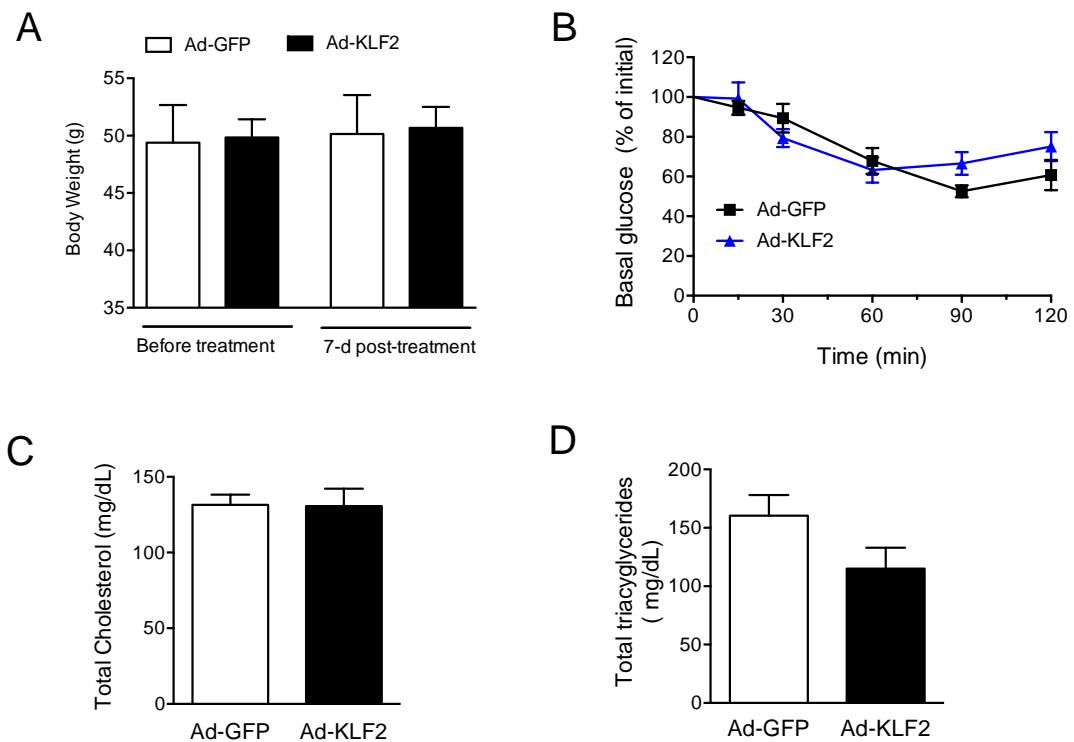

Supplementary Figure 1

Supplementary Figure 1. The mRNA expression level of *Nos3* and *Cnn1* in mouse aortas.

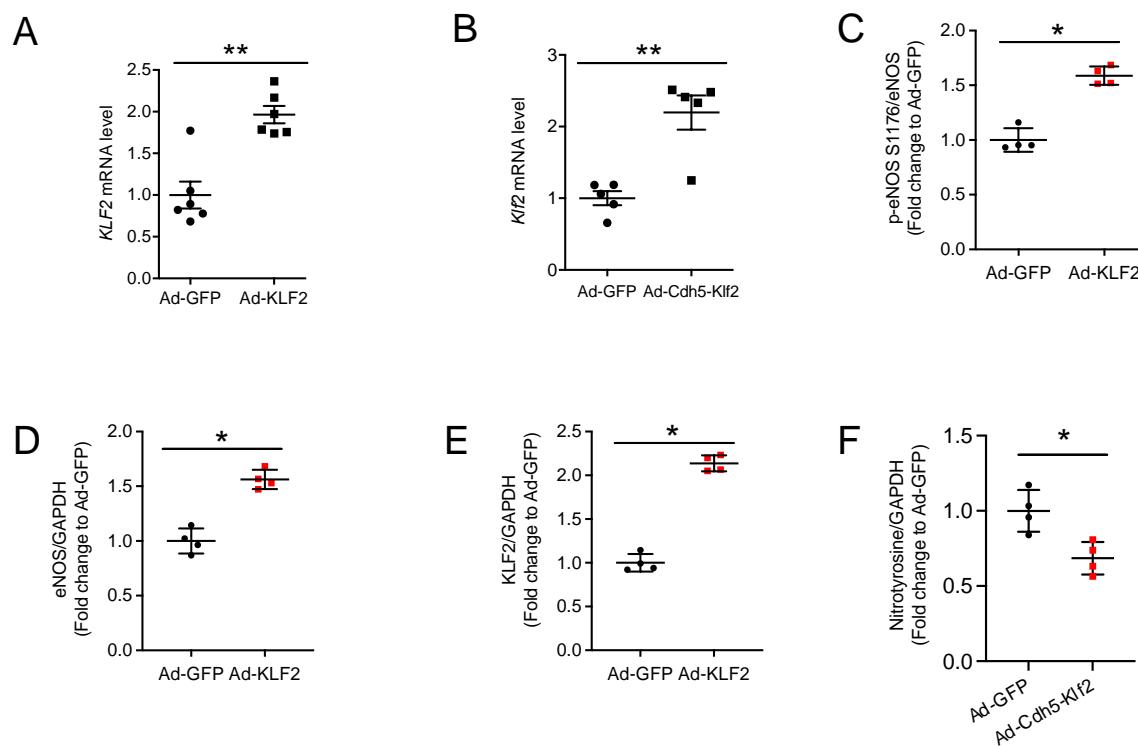

Real-time qPCR data showing *Nos3* (A) gene expression in aortas from db/m^+ and db/db mice and *Cnn1* (B) gene expression in aortas from C57BL/6 mice subjected to 7-day treadmill exercise. EC+ indicates intact mouse aortas with endothelium, EC- indicates mouse aortas with endothelium denuded. * $p<0.05$ vs db/m^+ (EC+), unpaired two-tailed *t* test.

Supplementary Figure 2

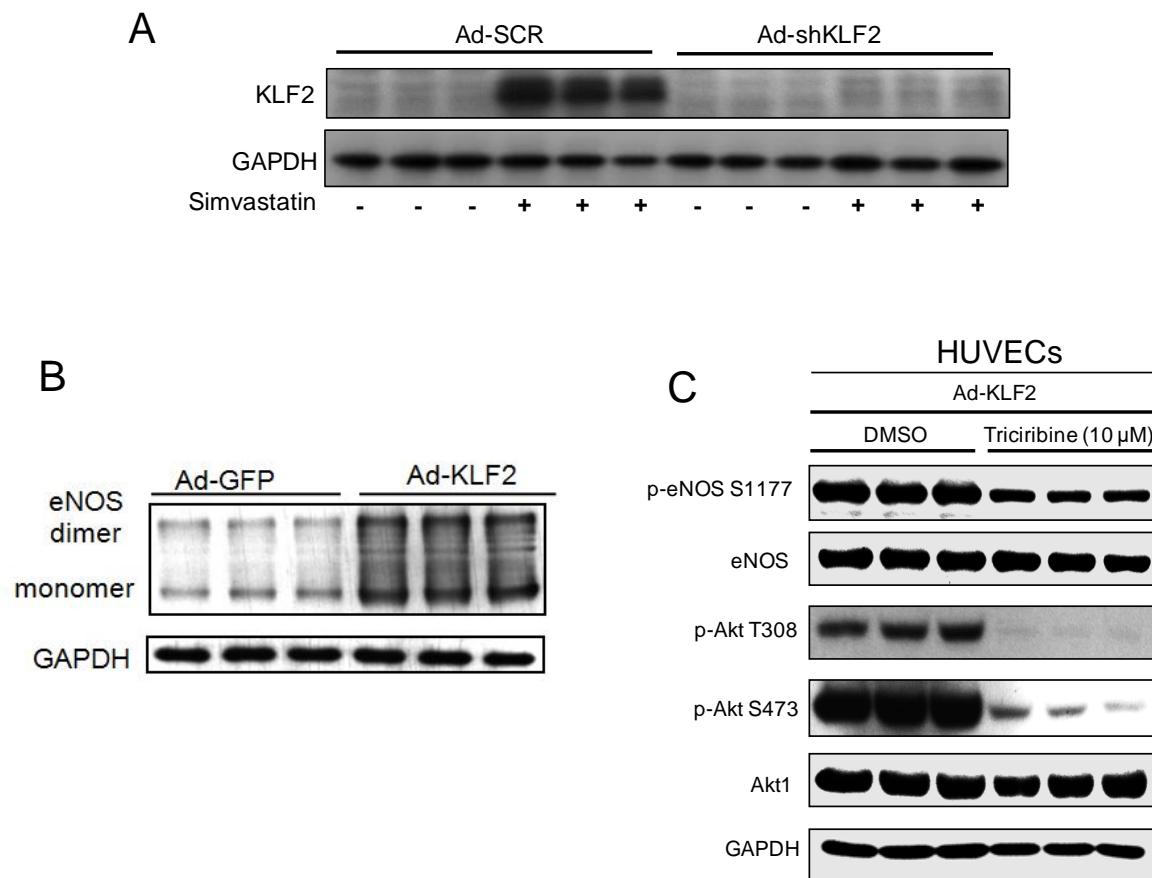

Supplementary Figure 2. The effect of Ad-KLF2 overexpression on the body weight, insulin sensitivity and lipid profile of *db/db* mice. Ad-KLF2 administration for 7 days to *db/db* mice does not affect body weight (A), insulin sensitivity indicated by Insulin Tolerance Test (B), total plasma cholesterol (C) and total plasma triacylglyceride levels (D).

Supplementary Figure 3

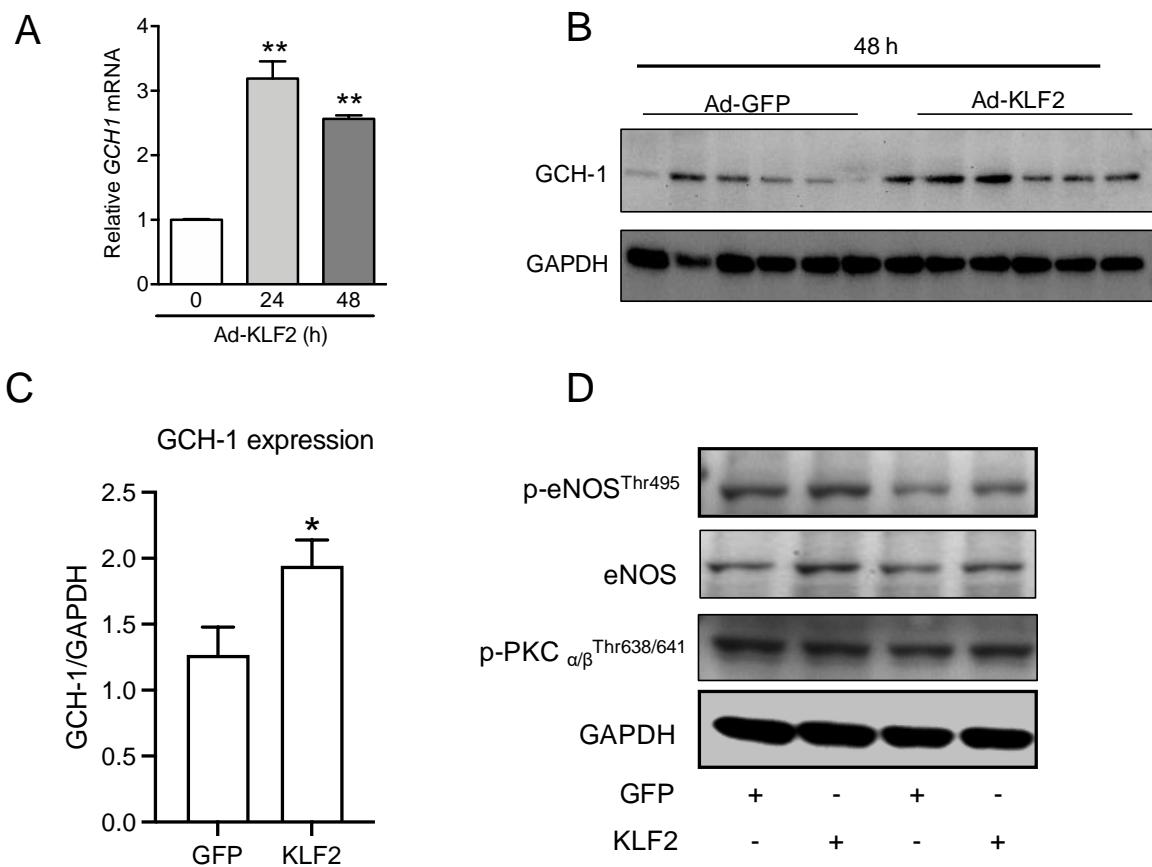

Supplementary Figure 3. KLF2 overexpression increases levels of KLF2, eNOS and p-eNOS S1176. QPCR results showing Ad-KLF2 (**A**) and Ad-Cdh5-Klf2 (**B**) increase KLF2 mRNA level in mouse aortas from *db/db* mice. Summarized western blotting data showing Ad-KLF2 upregulates levels of p-eNOS S1176 (**C**), total eNOS (**D**) and KLF2 (**E**) in mouse aortas from *db/db* mice. Summarized data showing Ad-Cdh5-Klf2 decreases the level of tyrosine nitrated proteins in aortas from *db/db* mice (**F**). ***p*<0.001 vs Ad-GFP, **p*<0.05 vs Ad-GFP, unpaired two-tailed *t* test.

Supplementary Figure 4

Supplementary Figure 4. KLF2 increases eNOS dimerization and Akt inhibitor Triciribine abolished KLF2-induced p-Akt and p-eNOS. (A) Ad-KLF2-shRNA (Ad-shKLF2) abolished simvastatin-induced expression of KLF2 in HAECS. (B) Ad-Klf2 increased level of eNOS monomer and dimer in HUVECs. (C) Triciribine (10 μ M) treatment for 12 hours inhibited KLF2-induced p-Akt T308, p-Akt S473 and p-eNOS S1177 but not total Akt and eNOS.

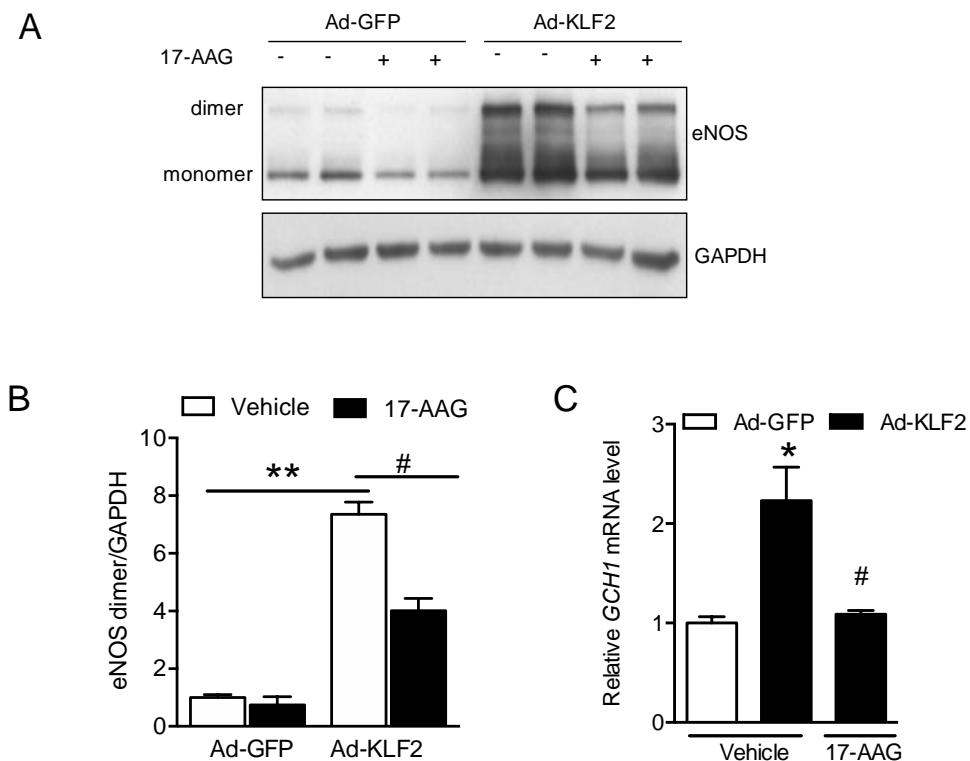

Supplementary Figure 5

Supplementary Figure 5. KLF2 upregulated mRNA and protein expression of GCH-1.

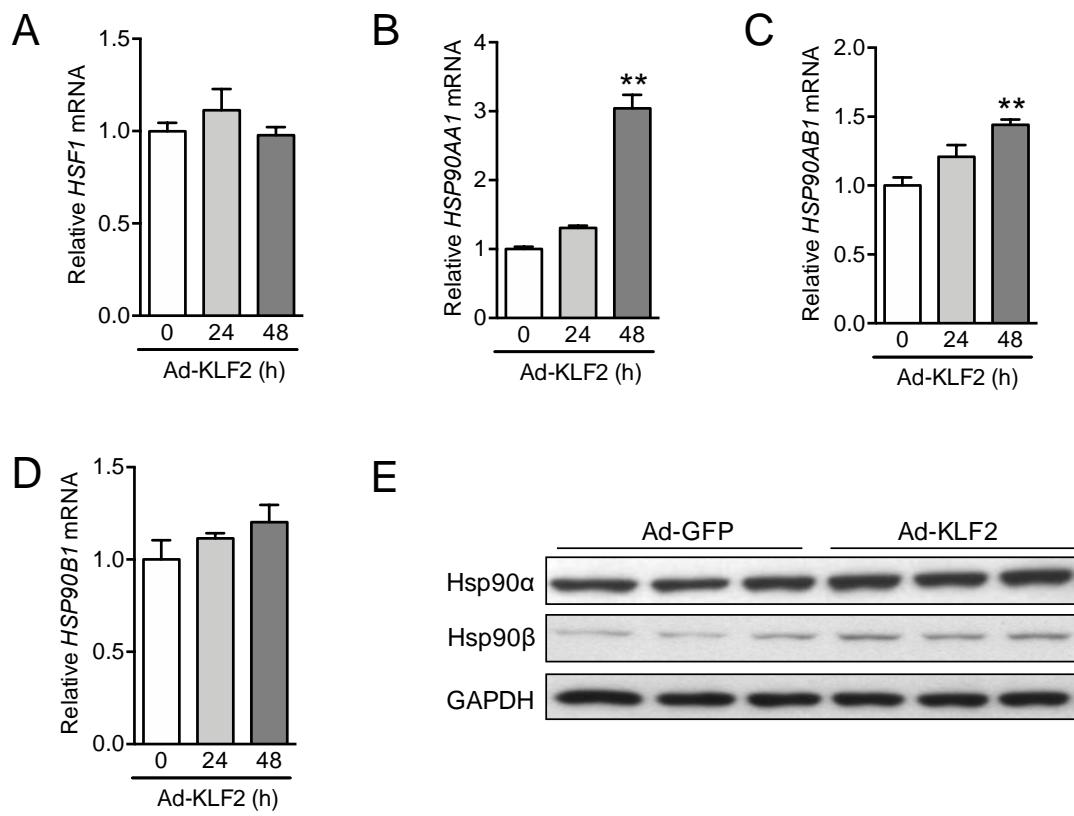

The qPCR results (**A**) and western blotting data (**B** and **C**) showing KLF2 overexpression increased GCH-1 mRNA and protein expression in HUVECs. ** $p < 0.01$ vs Ad-GFP, One-way ANOVA with Tukey's multiple comparison test. * $p < 0.05$ vs Ad-GFP, unpaired two-tailed t test. (**D**) The effect of KLF2 overexpression for 24 hours on levels of p-eNOS threonine 495 and p-PKCa α/β threonine 638/641 in HUVECs.

Supplementary Figure 6

Supplementary Figure 6. KLF2-induced eNOS dimerization and GCH1 mRNA expression were suppressed by Hsp90 inhibitor 17-AAG. Western blotting images (A) and summarized data (B) showing 17-AAG (1 μ M) treatment for 12 hours attenuated KLF2-induced eNOS dimer formation. ** $p < 0.01$ vs Ad-GFP+ Vehicle, # $p < 0.05$ vs Ad-KLF2+Vehicle, Two-way ANOVA with Tukey's multiple comparison test. (C) GCH1 mRNA expression induced by KLF2 was inhibited by 17-AAG (1 μ M) treatment in HUVECs. * $p < 0.01$ vs Ad-GFP+ Vehicle, # $p < 0.05$ vs Ad-KLF2+Vehicle, Two-way ANOVA with Tukey's multiple comparison test.

Supplementary Figure 7

Supplementary Figure 7. KLF2 increased the mRNA and protein level of Hsp90 α and Hsp90 β but did not affect HSF1 mRNA level. The qPCR results showing KLF2 overexpression for 24- and 48-hours upregulated mRNA expression of *HSP90AA1* (**B**) and *HSP90AB1* (**C**) but did not change the mRNA expression of *HSF1* (**A**) and *HSP90B1* (**D**). ** $p < 0.01$ vs Ad-GFP, One-way ANOVA with Tukey's multiple comparison test. (**E**) Western blotting images showing KLF2 upregulated Hsp90 α and Hsp90 β protein levels in HUVECs.

Supplementary Table 1

Gene name	Primer sequences	Species
<i>Klf2</i>	F: CTCAGCGAGCCTATCTTGC R: CACGTTGTTAGGTCCATCC	Mouse
